(19) You are considering putting money into an account that is being compounded continuously. (a) How much do you need to invest today, at a rate of 3.9%, to have \$5,000 after 8 years?

(b) How long will it take to turn \$4,000 into \$8,000 if the account has a rate of 2.75%

$$2 = e^{.0273}$$

$$\lambda = e^{.0275 t}$$
  $\log_{1.03}(\lambda) = t$   
 $\lambda = 1.03^{t}$   $t = 23.45$ 

(c) What rate would you need to turn \$700 into \$1,000 in 10 years?

(20) Once a hurricane reaches land, the wind speed, s (in knots) within the hurricane is related to the time t (in hours) the hurricane remains over land. The equation below can be used to model a hurricanes wind speed.

$$s = -56.8 \log t + 118$$

(a) What would the wind speed be of a hurricane that just hit land 15 minutes ago?

$$10^{174} = t$$
 $16 = 5.75$
